English

C1 Advanced — EF SET 89/100

Vadim Kubrak

DATA ENGINEER · DATA ANALYST

I work at **both ends of a data problem**: I build the pipelines that collect the data and put it in order, and I do the analysis that says what it means. Python and SQL on PostgreSQL, ETL/ELT, schema design, scheduled jobs, FastAPI where the data needs an interface. What I ship, I keep running: Docker, Linux, CI/CD, TLS, monitoring, backups, incident response.

Experience

Data Engineer | Nizhny Novgorod City Administration

Jun 2026 — present

Data-engineering team, ProcureCheck

- I build ProcureCheck, a service that checks public-procurement document packages against Russian federal laws 44-FZ and 223-FZ. Four files go in — the notice, the draft contract, the object description and the bid requirements — and a short summary plus a full report across 20 checks come out.
- Python, FastAPI, PDF and DOCX extraction (PyMuPDF, pdfplumber), Docker, GitLab CI. **I am the repository's main author, with more commits than anyone else on the team.**
- The service runs in a city department every day. Three staff complaints about false findings turned out to be one bug: the converter was gluing words together with no spaces between them. I fixed the cause rather than the three symptoms, and separately found a place where 52 specification rows were silently dropped from a real document.

Data Analytics Intern | Gazprombank (JSC), Moscow

Mar — Aug 2026

Product and customer analytics

- Pulled data from several warehouse tables — transactions, customer profiles, operation history — joined and cleaned it in SQL, and built an analytical view on top: customer segmentation, cohort retention, activity, average transaction value and churn.
- Showed the results as interactive Python dashboards (pandas, NumPy, Matplotlib, Plotly). Each one came with a short takeaway in plain language instead of a wall of numbers.
- My main piece of work there was automating the recurring report. A pipeline collects data from several sources, computes the metrics, and a language model writes the commentary analysts used to type by hand. All of it sits behind an internal FastAPI web interface.

Result: the report that used to take most of a working day is now ready in about fifteen minutes.

Multi-node private network platform for friends and family; shut down cleanly

- A Remnawave control plane over a fleet of Xray/VLESS nodes: master node in Germany, a Moscow cascade, international exit nodes.
- I provisioned nodes through the panel's API, generated per-client routing rules and put user onboarding behind a Telegram bot on FastAPI. TLS, nginx, systemd, monitoring, backups and incident response were all mine, from the first machine to the last.

Projects

Golf Club CRM

2025 — 2026

Club management system, in production for its client

- FastAPI and SQLAlchemy backend: **53 REST endpoints**, 25+ database tables, JWT auth over httpOnly cookies.
- React 18, TypeScript, Vite and TanStack Query front end: booking tee-sheet and analytics dashboards. Docker Compose, nginx with TLS, Alembic, PostgreSQL.

LLM University Math Benchmark

2026

Open dataset and harness, CC BY 4.0 / MIT

- I ran 12 language models through 75 university mathematics problems. What gets graded is the **solution process**, not just the final answer: a multi-criterion rubric with a language model acting as the judge.
- 887 of 900 responses scored, and the differences between models are significant (Friedman test, $p < 0.001$). Problems with reference solutions, raw model outputs, prompts and scoring code are public in Russian and English.

Argus

2026

Local-first desktop command centre in Electron

- My own servers, subscriptions, spending and AI-provider quotas in one window. The store is SQLCipher with an Argon2id key, and secrets never leave the privileged process.
- The hard part was reporting state honestly: “unreachable” and “off” are different things, so a single failed poll never marks a live machine as down. **994 tests across 87 files.**

→ github.com/Archangel-gabri/argus

MedSpravki REU

2026

Medical-certificate registry for a university PE department

- ASP.NET Core and PostgreSQL. A local Ollama vision model reads scanned certificates and fills in the database fields, leaving a person only the check. Runs on real hardware.

Clean Listings & Price Elsewhere

2026

Two open-source browser extensions, MV3, MIT

- Clean Listings filters resellers out of a classifieds page by its own criterion rather than the site's, whose own “private sellers” filter still lets shops through. I profiled rather than guessed — a page freeze of **0.8 seconds went down to 0.19**; 28 regression tests.
- Price Elsewhere compares a price across three marketplaces that share no product identifier, matching on brand, model and numbers. It reports the usual price rather than the cheapest hit, because counterfeits and wrong bundles live in the cheap tail, and it says as much when the match is uncertain.

Ghost | GORKYCODE 2025 hackathon

2025 — 2026

Voice-and-screen assistant in PySide6/Qt · AI service for procurement paperwork

- Ghost hears a spoken question, reads what is on screen and streams the answer into an overlay. A separate thread owns the whole audio → speech-to-text → model chain and talks to the UI only through signals, so the window never freezes while transcription runs.
- GORKYCODE: initial-price calculation and technical-specification drafting under 44-FZ, requirement gathering as a dialogue over a webhook, GigaChat for parsing the answers. **Specification drafting: eight hours → minutes.**
