English

C1 Advanced — EF SET 89/100

Vadim Kubrak

DATA ENGINEER · DATA ANALYST

I work at **both ends of a data problem**: I build the pipelines that make the numbers available, and I do the analysis that makes them mean something. Python and SQL on PostgreSQL, ETL/ELT, relational modeling, scheduled jobs, FastAPI where an interface is needed — and I stay responsible for what I ship: Docker, Linux, CI/CD, TLS, monitoring, backups, incident response.

Skills & technologies

DATA ENGINEERING

Python SQL PostgreSQL SQLite ETL / ELT Relational data modeling
Data quality Scheduled jobs Historical backfill Bulk upsert SQLAlchemy Alembic
openpyxl

ANALYTICS

Cohort retention Customer segmentation Churn & activity Average transaction value
pandas NumPy Matplotlib Plotly Statistics Jupyter

BACKEND & API

FastAPI Pydantic REST API JWT ASP.NET Core Telegram Bot API

AI / LLM

Claude API OpenAI API OpenRouter MCP RAG Multi-agent orchestration
Prompt engineering LLM-as-a-judge Vector search Ollama scikit-learn PyTorch

INFRASTRUCTURE & DEVOPS

Linux Docker Docker Compose nginx systemd TLS GitLab CI GitHub Actions
CI/CD Grafana Prometheus Playwright Git

FRONTEND

TypeScript React 18 Vite TanStack Query Tailwind CSS Electron

Experience

Data Engineer | Nizhny Novgorod City Administration

Jun 2026 — present

Data-engineering team, ProcureCheck

- Automated compliance checking of public-procurement document packages under Russian federal laws 44-FZ and 223-FZ: four documents go in, a short summary and a full report across twenty checks come out.
- Python, FastAPI, PDF and DOCX extraction (PyMuPDF, pdfplumber), Docker, GitLab CI. **More commits in the project than anyone else on the team.**
- Now in live use by a city department. Traced three false findings reported by its staff to a single root cause — a converter emitting text without word boundaries — and fixed the class rather than the three symptoms; separately closed a silent loss of 52 specification rows.

Data Analytics Intern | Gazprombank (JSC), Moscow

Mar — Aug 2026

Product and customer analytics

- Pulled and joined data from several warehouse tables (transactions, customer profiles, operation history) in SQL and built an analytical view: customer segmentation, cohort retention, activity, average transaction value and churn.
- Presented findings as interactive Python dashboards (pandas, NumPy, Matplotlib / Plotly), each with a short business-readable takeaway rather than a wall of numbers.
- Main deliverable: an internal FastAPI pipeline that collects data from several sources, computes the metrics and lets a language model draft the narrative commentary analysts previously wrote by hand.

Result: report preparation went from most of a working day to about fifteen minutes.

Own multi-node private network platform, shut down cleanly

- A Remnawave control plane over an Xray/VLESS fleet: German master node, Moscow cascade, international exit nodes.
- Node provisioning through the API, client-specific routing generation, Telegram-first onboarding on FastAPI; TLS, nginx, systemd, monitoring, backups and incident response — handled end to end.

Projects

Golf Club CRM

2025 — 2026

Production club-management system, running for its client

- FastAPI + SQLAlchemy backend: **53 REST endpoints**, 25+ database tables, JWT auth over httpOnly cookies.
- React 18 + TypeScript + Vite + TanStack Query front end: booking tee-sheet and analytics dashboards; Docker Compose, nginx with TLS, Alembic, PostgreSQL.

LLM University Math Benchmark

2026

Open dataset and harness, CC BY 4.0 / MIT

- 12 language models against 75 university mathematics problems, graded on the **solution process** rather than the final answer through an LLM-as-a-judge rubric.
- 887 of 900 responses scored, Friedman $\chi^2 = 351$, $p < 0.001$. Problems with reference solutions, raw model outputs, prompts and scoring code are public in Russian and English.

Argus

2026

Local-first desktop command centre in Electron

- Own servers, subscriptions, finances and AI-provider quotas in one window. The store is SQLCipher with an Argon2id key; secrets never leave the privileged process.
- The interesting constraint was honesty of state: “unreachable” and “off” are different things, so one failed poll never marks a live machine as down. **994 tests across 87 files**.

→ github.com/Archangel-gabri/argus

FX Analytics

2026

Multi-agent currency-risk analysis for an exporting company (project closed)

- Four agents on the Claude API with tool use (orchestrator → collector → quant + macro → reporter), plus an MCP server.
- Asynchronous ingestion from Central Bank XML, MOEX ISS and yfinance, normalization, historical backfill, bulk upserts and scheduled reports. About \$2.30 of model cost per full analysis.

MedSpravki REU

2026

Medical-certificate registry for a university PE department

- ASP.NET Core + PostgreSQL, with a local Ollama vision model reading scanned certificates into structured rows. Runs on real hardware.

→ github.com/Archangel-gabri/medspravki-reu

Clean Listings & Price Elsewhere

2026

Two open-source browser extensions, MV3, MIT

- Clean Listings filters resellers out of a classifieds search page by its own criterion rather than the site's. Profiled rather than guessed: **a 0.8-second render freeze cut to 0.19 seconds**; 28 regression tests.
- Price Elsewhere compares a product across three marketplaces that share no identifier — matching on brand, model and numbers — and reports the usual price rather than the cheapest hit, saying so plainly when the match is uncertain.

Ghost | GORKYCODE 2025 hackathon

2025 — 2026

Voice-and-screen assistant in PySide6/Qt · AI service for procurement paperwork

- Ghost hears a spoken question, reads what is on screen and streams the answer into an overlay; a QThread owns the whole audio → speech-to-text → model chain and talks to the UI only through signals, so transcription never freezes the window.
- GORKYCODE: initial-price calculation and technical-specification generation under 44-FZ, multi-step requirement gathering over a webhook, GigaChat for analysing answers. **Specification drafting: eight hours → minutes**.
